## Pattern Ideas

CARPET COURT TILE LAYOUTS

## How To Order

- 1. Measure the space to be covered, whether it's a floor, countertop or wall. For more accurate measurements, deduct LARGE spaces occupied by cabinets, permanent appliances, bath fixtures and other obstructions to the flow area.
- 2. Calculate the square footage of tile needed by multiplying the length of the space by the width. Length x Width = Square Footage (Sq. Ft.). Example: 10x10 room = 100 sq ft Don't forget to subtract those areas that interrupt the flow of the space.

- 3. Select the pattern and sizes desired.

  Be sure to note any borders and corner pieces you want to include as part of your pattern, and consider any special trim pieces you may need for countertops, entryways, edging, corners and stairs.
- 4. Multiply the percentages of each tile size from the pattern desired by the total square footage needed to determine the square footage of each size tile needed for your application.
- 5. Depending on the pattern desired, you will need approximately **10% extra tile** to allow for waste. Also consider extra tile to allow for future use or replacement. Round the order amount up to the box count for most standard tile. Some tile may be ordered by the piece.

PLEASE NOTE: This pattern idea guide book is designed to be used for your to get ideas but it does not have every possible design. You can print out any of the pages to use for any of your jobs. If you have a design that you want the installers to do, just specify the design, print it out and attach it to the drawing of the area. When selecting a pattern design make sure that you have the sizes of tiles needed for that specific design. When You type the Job Name it will show on all pages. It is best to type the Job Name with the invoice right after the Job Name.

It is best not to have the customer go through the book, but rather you can reference the design and show them a specific design you have in mind. DO NOT GIVE THEM A PRINT OUT OF THE DESIGN!!!

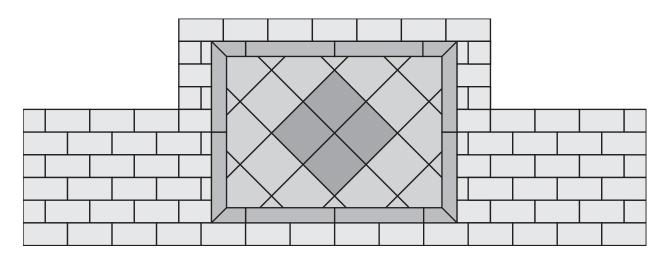

## How to design and measure for a backsplash

A backsplash serves as more than a decorative accent in your kitchen. It also protects your walls from grease, water and food damage, as well as compensates for undesirable architectural issues.

When considering a backsplash design, take the entire space into account. Be sure the size and shape of the tile works well with the area in which it will be installed. Colors should work with all of the details in the room. They can blend in, or be in bright contrast to stand as the focal point.

Think about how high you want the backsplash to run up the wall. Your tile should start at the countertop and can run anywhere between four inches up the wall to the bottom of the upper cabinets, or all the way to the ceiling behind a hood.

Do you want a border to run around the perimeter? Or would you rather run a decorative liner through the field of tile? Decorative liners should not be placed too close to the upper cabinets. Using the rule of thirds will keep the design balanced: divide the space into three equal horizontal sections, and keep your strong design elements within those boundaries. Consider a mosaic behind the stovetop or decorative tiles placed randomly throughout the area. Many of the pattern designs shown in this book can be used for backsplashes by altering the proportion of the tiles or by rotating the design. Whatever you choose, it is a good idea to draw the entire design on paper to ensure scale & placement of decorative tiles.

## Basic Back Splash Design

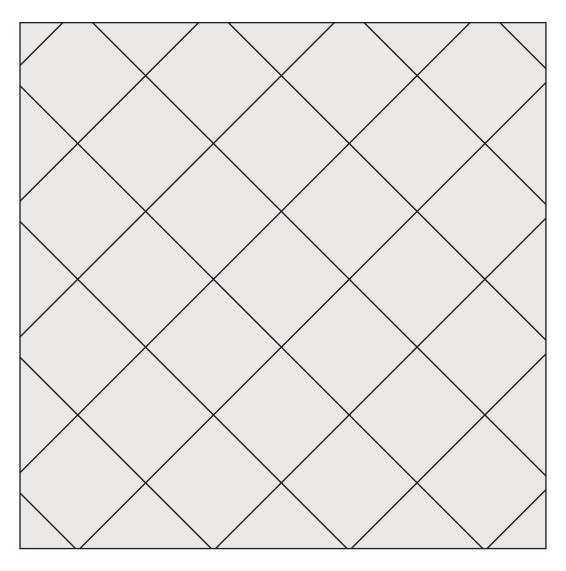

<sup>\*</sup> Amount of tile needed depends on the dimensions of the actual installation. The same rules apply to a backsplash as with floors. Length x Width - Int. Sp.
